The Electric Telegraph 1860-1914

By Thomas H. White

ELECTRIC TELEGRAPH DEVELOPMENT AND MORSE CODE

The electric telegraph revolutionized long-distance communication, replacing earlier semaphore communication lines. In addition to its primary use for point-to-point messages, other applications were developed, including printing telegraphs ("tickers") used for distributing stock quotes and news reports

Early communications development included a variety of semaphore telegraph lines, where spotters used visual signals to relay messages from one elevated location to the next. By the early 1800s, these mechanically-operated visual telegraph lines were fairly common in Europe, although only a few simple links were ever built in the United States. However, visual telegraphs were slow, covered limited distances, and were usable only during good visibility, so inventors worked to develop a way to send signals by electrical currents along wires, which promised nearly instantaneous transmissions over great distances in all kinds of weather. But progress was slow, in part because the nature of "electrical fluid", as it was then known, was poorly understood.

William Cooke and John Wheatstone developed the first electric telegraph service, which began operating in 1837. The earlier mechanical telegraph used visual signaling, two needles at a time, on the receiving device to represent letters. Meanwhile, other inventors based on different principles, Samuel Morse in the United States, developed a system that imprinted dots and dashes on a moving paper tape. (Later, operators would learn to read the dots and dashes directly, by listening to the clicking of the receiver). In 1844, the first commercial line using Morse's design went into service between Washington, District of Columbia and Baltimore, Maryland. Its success was followed by the rapid construction of telegraph lines throughout the United States, and eventually Morse's dot-and-dash approach became the worldwide standard. Although the electric telegraph made most visual telegraphs obsolete, telegraph wires couldn't be run out to sea, so, until the development of radio, a few semaphore links continued to provide ship-to-shore communication. A Semaphore Telegraph Station, from the April 20, 1895 issue of the *Scientific American Supplement*, described a French shoreline installation, which displayed meteorological signals, sent messages to passing ships, and also received commercial telegrams sent from the ships by semaphore.

Morse used standardized sequences of dots and dashes to represent individual letters and numbers for transmitting messages, and this became known as the American Morse Code. However,

"This is the age of telegrams. The public is accustomed to the consideration of facts in the briefest terms."
--*The Science Record for 1873*

Charles Wheatstone developed the first commercial telegraph in England in 1838. Like the earlier mechanical telegraph, this pioneer electrical telegraph -- in its initial configuration -- consisted of a total of five, rotated points to letters on a display. The most important being the first telegraph worked on electric telegraphs the most important being the States, who developed a system of dashes on a moving paper tape. (Later, operators would learn to read the dots and dashes directly, by listening to the clicking of the receiver). In 1844, the first commercial line using Morse's design went into service between Washington, District of Columbia and Baltimore, Maryland. Its success was followed by the rapid construction of telegraph lines throughout the United States, and eventually Morse's dot-and-dash approach became the worldwide standard. Although the electric telegraph made most visual telegraphs obsolete, telegraph wires couldn't be run out to sea, so, until the development of radio, a few semaphore links continued to provide ship-to-shore communication. A Semaphore Telegraph Station, from the April 20, 1895 issue of the *Scientific American Supplement*, described a French shoreline installation, which displayed meteorological signals, sent messages to passing ships, and also received commercial telegrams sent from the ships by semaphore.

Tubs of Tubes

by Dan Romanchik, KB6NU

The other day I got a call from a guy whose website I'm working on. He says he's calling from the Ann Arbor Reuse Center and that they have two tubs full of vacuum tubes there.

He asked, "Do you know anyone who might want them"?

"How much are they asking for them"?

I reply, "Ten cents a piece."

"How many are there"?

"I'd guess about two hundred."

"Well, tell them I'll give him 20 bucks for all of them."

He tells them that I'll give them \$20 for the lot. I hear some mumbling. He comes back on the line and says they're negotiating. After a minute or two, he says, "OK. You got them. How do I get to your house"?

I gave him directions, and in about 15 minutes, he pulls up to my house, gets out, opens the hatch, and pulls out two plastic tubs and a cardboard box with vacuum tubes in them. I can tell he was way off in his estimate. There must be at least 400 tubes in all.

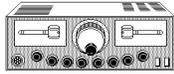

There's nothing really exotic--most of them seem to have been taken out of old TV sets--but I did find a couple of 6J6s. These are the tubes used for the single-tube transmitter I have been thinking about building. In one of the tubs, there was even a socket for the 6J6.

There are also a bunch of 6KS7s. According to the RCA tube manual, these tubes were often used as RF or IF amplifiers. That sounds like the beginning of a receiver project, doesn't it? In fact, 6SK7s were used in the receiver section of the ParaSet, a "spy radio" used during WWII.

And, of course, there are a bunch of rectifiers to make a power supply. Now, all I

THE ZARC CARRIER

The Zarc Carrier is the newsletter of the Zanesville Amateur Radio Club, located in Zanesville, Muskingum County, Ohio and is published January, March, May, July, September, and November.

Send in your items of ham related interest, such as swap n shop ads, new hams in the area, birthdays, anniversaries, silent keys, ham fests, special events, and original written articles. Deadline is the first of the month before the month to be published. Enclose a SASE if your material is to be returned to you.

Any material in *The Zarc Carrier* may be reprinted as long as you give credit to the newsletter, the original author, and the original publication, if given.

Sample copies are available upon request and a SASE. If your club receives a complementary copy of *The Zarc Carrier*, we would appreciate a copy of yours in exchange.

ZARC MEMBERSHIP

The Zanesville Amateur Radio Club is an incorporated not-for-profit association. Membership is open to anyone interested in the purposes of the organization and who agrees to abide by the by-laws and other rules and regulations that may, from time to time, be established by ZARC.

From the Secretary

ZANESVILLE AMATEUR RADIO CLUB

Zippo Gillogly K8CYN

Date: 5 Feb 2008

Time: 7:00 PM

Location: Muskingum Co. EOC

Attendees:

(13) KA8UXT, N8KBR, WA8BOV, KD8WA, W8TJT, KB8ZXH, KA8UWO, AC8AD, AD4CO, N8IMW, W8FHF, N8LJF, WA8BNS, KB8RIM

Minutes:

President Joe, KA8UXT, called the meeting to order.

Secretary's Report - Minutes of the 4 Dec 2007 and 8 Jan 2007 Meeting were read by Vice-President Earl, N8KBR. Minutes were moved and seconded, as read.

Treasurer's Report - The Treasurer's Report was provided by Don, WA8BOV. Balance as of the meeting was \$189.45. Report was moved and seconded, as read.

Old Business -

- Meeting Place has been established at EOC with an agreement between Sonny, W8FHF, District 9 DEC, and the EMA Director. Sonny Alfman has a key.
- Backup meeting place has been established at Washington Twp. Fire Dept. with an agreement signed between the Club President, Joe, KA8UXT, and Fire Chief Gene Hanning dated 9 January 2008. The text of the letter was read to the attendees and is posted on the website message board. Joe provided instruction to the attendees related to where to park, etc.
- N8LJF has been taking care of the repeater. Thank you Don.
- Backup for Secretary is needed. Earl, N8KBR has filled in during the past few meetings. He reported he will not be able to attend the March 2008 meeting due to a business trip. Lyn, N8IMW, will help.
- Joe, KA8UXT, mentioned the need for more publicity. Earl, N8KBR, (PIO) indicated the efforts that currently happen monthly and the great press received at Field Day from WHIZ and the Times Recorder.
- The proposed revision to the By-laws was discussed and the proposed narrative was revised in accordance with a motion and second. Earl, N8KBR, re-read the proposed revision for the attendees to ensure clarity and understanding. Sonny, W8FHF, volunteered to do the physical mailing of the proposal with the hope of voting on the changes at the May 2008 meeting. Earl, N8KBR, will send to email addressees and post to the website.

New Business:

- Dwight, W8TJT, and Don, N8LJF, provided a report on how Zippo is doing after his stroke. Zippo is at the Clay House, Room #113, Phone Number: 452-7037. Please remember him in your prayers and visit him.
- Joe, KA8UXT, asked everyone to introduce themselves.
- Sonny, W8FHF, gave a report related to EMA & ARES activities. He is currently looking for a person to sign on as the Muskinum Co. ARES Emergency Coordinator. He's filling that square for now. He briefed the attendees on CERT and LEPC Committee activity and indicated he would be providing a briefing at a future meeting.
- Earl, N8KBR, reported that he will be giving a presentation at the Newark ARA meeting this coming Saturday, 9 Feb 2008 @ 7:00 PM related to Amateur Radio Volunteer Examiner program. He offered to present this topic at a future meeting of ZARC and will be presenting the program at an upcoming meeting of the Cambridge ARA on 23 Feb 2008 @1000.

Meeting Adjourned.

Minutes recorded by Earl Paazig, N8KBR in Zippo's stead.

The Electric Telegraph 1860-1914

From page 1

Morse's original code specification included a few oddities, so although American Morse was widely adopted throughout the United States, a more consistent version was developed in Europe, known as Continental Morse Code. Telegraphic Codes, from the 1912 edition of the Electro-Importing Company's *Wireless Course*, compares the American and Continental Morse Codes with a third, short-lived code used by the U.S. Navy. Radio would also adopt dot-and-dash signaling in its early days, and radio operators generally used the same telegraphic codes as landline telegraphy, so at first most U.S. radio stations used American Morse, while a majority of the rest of the world used Continental Morse. However, radio's use in international communication meant that a single standard telegraphic code was needed in order to avoid confusion. Eventually Continental Morse was universally adopted for radio communication, and, reflecting its expanded status, it became known as International Morse. Meanwhile, the original American Morse largely disappeared from radio use.

TELEGRAPHIC NEWSGATHERING AND TIME SIGNALS

Although the telegraph was mostly used for sending individual messages, other more general applications were also developed. As lines spread throughout the country, the telegraph was recognized as ideal for rapidly gathering and distributing news items. In George B. Prescott's 1860 *History, Theory and Practice of the Electric Telegraph*, The Associated Press of the United States section reviewed the first telegraphic press association, which had been formed in 1848. (The Associated Press would later take seriously the threat that radio newscasts posed to newspaper sales. From 1922 to 1939 AP greatly restricted use of its reports by radio stations -- even those owned by newspapers -- in what became known as the "Press-Radio War"). It also became common to run special telegraph lines to major sporting events, so newspapers could receive up-to-the-minute reports. Banks of operators would be set up in the stands, each clattering away at their keys, such as those shown in *Electrical Service at Harvard-Yale Football Game from the December 6, 1913 The Electrical World*.

An important innovation occurred beginning in the late 1840s, when Great Britain used telegraph lines to establish standardized time throughout the country. The United States was somewhat slower to adopt this practice. The first step was to establish regional "railroad times", based on the solar noon at selected hub cities, which varied by railroad company. On the Allegheny System of Electric Time Signals by Samuel Pierpont Langley, from the 1873 *Journal of the Society of Telegraph Engineers*, reviewed how an astronomical observatory located near Pittsburgh, Pennsylvania had expanded its telegraph time service, originally provided to local jewellers, in order to establish a standard time for use along the Pennsylvania Central Railroad lines. It wouldn't be until 1883 that the various railroad companies agreed on a common standard, using hourly time zones offset from the base time at the Greenwich Royal Observatory in London, England. Eventually the United States Naval Observatory in Washington, D.C. began using telegraph lines to transmit daily time signals nationwide, as reported in *Distribution of Time Signals by Waldon Fawcett, from the March, 1905 The Technical World*.

NEWS AND ENTERTAINMENT DISTRIBUTION

The information gathered by press associations was generally made available only to member newspapers. However, the introduction of printing telegraphs -- informally known as "tickers" - - which printed letters and numbers on paper tape, made it possible to also distribute news and information directly to paying customers. The original services were set up in major cities, serving mainly businesses and club, but also a few private homes. At first subscribers received stock and commodity prices, but later news items were added. The February 13, 1910 issue of *The New York Times* detailed the competitive race between ticker services in that city to provide "Fresh News Every Minute", while in the April, 1914 issue of *Technical World Magazine*, C. F. Carter's *Within a Tick of the News* reviewed a New York City based news distribution service which provided "up-to-the minute knowledge of what the outside world is doing" to customers for whom even hourly newspaper editions were not enough. And the 1914 edition of the *Our Wonder World* encyclopedia included a photograph, *Receiving News of the "Titanic" Disaster Over the Electric News Tape System*, of persons receiving ticker reports of the 1912 sinking.

The telegraph was also sometimes utilized for group connections, both by businesses and private citizens. In 1860, the *A Novel Meeting* section of *History, Theory and Practice of the Electric Telegraph* reported how thirty-three offices of the American Telegraph Company were linked together in order to conduct a business meeting. In the February, 1917 *QST* magazine, Irving Vermilya's *Amateur Number One* (telegraph extract) recalled a private line, begun in

The Electric Telegraph 1860-1914

From page 5

1903, which eventually connected forty-two locations, creating a telegraphic party-line for youths in Mount Vernon, New York to exchange messages with each other 24 hours a day. And in Germany commercial enterprises made use of an innovative printing-telegraph system that provided an early form of electronic mail, as the August 21, 1912 issue of *Electrical Review* and *Western Electrician* reported in The Teleprinter that "Business offices, large hotels and other establishments in Berlin and Hamburg, are now subscribers to the teleprinter exchange" and "Messages are thus sent and received directly and without any loss of time".

The clicking noise made by telegraph receivers led to audio experimentation, as recounted in Music by Telegraph section of *History, Theory and Practice of the Electric Telegraph*. Dr. G. P. Hachenburg spent many years promoting the use of telegraph lines to remotely operate distant musical instruments -- Musical Telegraphy, from the November 14, 1891 *Electrical Review*, was one review of his not-very-practical ideas, although, despite very little progress after more than thirty years of promotion, Hachenburg extolled his system as "An invention that in the near future will assert its importance as one of the great inventions of the age", and one with great financial potential, "For who would not pay an admission fee to hear this electro-music?" A somewhat more practical device, although not a financial success, was Dr. Thaddeus Cahill's electronic synthesizer, the Telharmonium. Marion Melius' Music By Electricity, from the June, 1906 *The World's Work*, reported that it was now "as easy to create music at the other end of fifty miles [80 kilometers] of wire as to send a telegraph message". A second reviewer, Thomas Commerford Martin, was equally impressed, and in the April, 1906 *Review of Reviews*, The Telharmonium: Electricity's Alliance With Music reported that "In the new art of telharmony we have the latest gift of electricity to civilization". The Telharmonium consisted of a massive assembly of 145 electrical alternators, whose currents could be combined using a musical keyboard to create a full range of notes. Although Cahill looked forward to today when four concurrent services would provide electronic music 24-hours a day to subscribing commercial establishments and private homes, the invention ultimately proved impractical, in part because the high currents produced interfered with adjoining telephone lines. In the March 8, 1907 *New York Times*, Music By Wireless to the Times Tower reviewed Lee DeForest's experimental radio broadcast of a Telharmonium concert, but, given the extremely crude nature of De Forest's arc-transmitter at this stage, it could hardly have impressed Cahill, whose Telharmonium was lauded for its "purity of tone".

EARLY WIRELESS SPECULATION

The earliest experimental telegraphs employed multiple connecting wires -- in some cases a wire for each letter of the alphabet -- but over time simpler setups requiring fewer wires were developed. By 1844, Morse's line between Baltimore and Washington consisted of just two wires, one carrying the electrical current for signaling, and the other acting as a return line, to make a complete circuit. However, it turned out that even that could be simplified, and the return wire eliminated, if the sending line was "grounded", i.e. physically connected to a plate buried in the earth. The ability to eliminate the return wire was something of a mystery at the time, and the phenomenon became known under the misnomer of the "ground return", since it was incorrectly thought that the return electrical current was somehow flowing through the ground all the way back to the sending location. Actually, the earth around the grounding point was acting as a sink, so the "return current" was not traveling any significant distance. However, this mistaken belief that "return" currents were traversing the ground for extended distances suggested the idea of signaling without any connecting wires at all. Investigating this possibility, disappointed experimenters quickly found they were unable to send electrical currents through the ground more than a few meters, which they found perplexing, given their mistaken belief that "ground return" currents were somehow readily traveling hundreds of kilometers. In 1860, the Steinheil's Telegraph section of *History, Theory and Practice of the Electric Telegraph* reviewed what was known about the seemingly contradictory phenomenon, finally concluding that "It must be left to the future to decide whether we shall ever succeed in telegraphing at great distances without any metallic communication at all." In the end, it turned out that there was in fact no way to send standard electrical currents for long distances through the ground. However, in 1895 Guglielmo Marconi would discover the next best thing -- ground-wave radio signals -- which were radio waves that used the earth as a waveguide, traveling across land and sea to the "great distances" envisioned by Steinheil.

The "Paraset" Suitcase Spy Transceiver of WWII

By Kenneth G. Gordon, W7EKB

This was one of the first truly successful miniaturized transceivers, built by or for Britain's S.O.E. (Special Operations Executive) which conducted sabotage, spying, and other nefarious activities behind German lines during WWII. The schematic I have shown below is most probably an early version, since another schematic I have shows a different keying system, a bit different transmitter section, and the voltage dividers for the receiver are different.

The "Paraset" receiver covers 3.0 to 7.6 MHz. in one band, while the transmitter covers slightly more than the receiver in two bands, selectable by a toggle switch. Power output is 4 to 5 watts. I think the transmitter is really neat. The transmitter output coupling system has the capability of matching

quite large variations in impedance. It seems as though there was much more thought expended on the transmitter than the receiver. It is rather crude even by 1939 standards. There is no "bandspread" tuning in this early version, nor an RF amplifier stage to isolate the detector from the antenna, nor is there any possible provision for any sort of sidetone so that it is impossible to hear your own sending.

Several people have built replicas of the "Paraset" and are operating them on the air. Mario, IK0MOZ has an entire and very complete web page devoted to this neat little rig. Here is the URL : http://www.qsl.net/ik0moz/paraset_eng.htm.

Continued on page 7

Jones 1936 Push-Pull Transmitter

By William U Walker, WV7G

Have you ever wanted to try your hand at building a CW rig using vacuum tubes? Well put it off no longer! Here is a neat little CW circuit which has been used for decades as a Novice Hams first transmitter. This circuit was published in the mid 1930's by Pacific Radio Publishing Co. in The Radio Handbook for Amateurs and Experimenters by Frank C. Jones. This book is still available today from Lindsay Publications Inc. and is a must have, in my opinion, for anyone interested in vintage radio construction. In his book, Frank used a single type 53 or 6A6 dual triode vacuum tube. Many Hams since have used a wide range of dual triodes or even two single triodes in this simple push-pull configuration.

Shown below are some images of one such transmitter that I put together using a small 6J6 dual triode. The 6J6 offers small construction options and requires only 150vdc for the plate voltage. The power supply for this little rig was constructed using a 1:1 isolation transformer for the plate and a small 6.3 volt filament transformer from Radio Shack. I have found 6J6 tubes for as little as \$0.25 each at hamfests and due to the low crystal current in this circuit, the small readily available HC49/U size crystals may be used. The note produced by this rig is mellow and has little or no chirp.

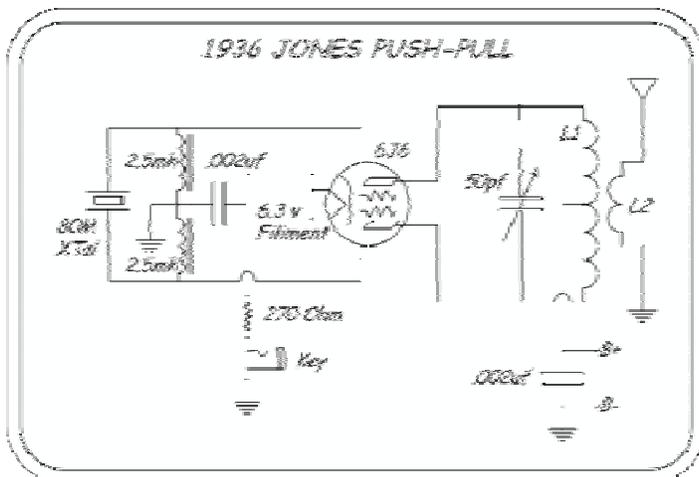

Front view with a FT-243 crystal plugged in. The 1/4" jack to the right of the crystal is for the strait key.

Top view showing parts placement

Top view showing size comparison with my strait key.

- **WARNING * WARNING ***

Lethal voltages are present on components and power connections. If you are not experienced working on or around high voltage equipment or electronic components, please seek a qualified person to help you.

This project may not be suitable as a first electronics project and you **must** be a properly licensed amateur radio operator in order to operate this transmitter.

If you choose to build this project or one similar, you do so by your own choice and at your own risk!

Circuit Data

L1 - 31 turns of 22 gauge enamled copper wire close wound on a 1.9" PVC form.
L2 - 2 turns of 14 gauge enamled copper wire loose wound over the center of L1.

B+ - 150 - 160 VDC

Plate Current - 24 ma

Output Power - ~2 watts (Depends on emission strength of the tube.)

Ham Radio for the compleat idiot.

jcox@x102a.ess.harris.com (Jamie Cox)

(true, smirk)

The following is an actual letter. The original was typewritten, and all spelling and grammar has been carefully left intact, including errors. I thought this was pretty funny.

To Mr. (name omitted) District Manager for Alabama Radio Shack 3300 N. Pace Blvd Pensacola, FL. 32505

Dear Sire,

This letter is complain about the problems I have having with the ham radio model number 19-1101 I had got from your company Radio Shack. I had this shipped special to me from your store 1096 Eastdale Mall Montgomery Alabama. I was got this because I think that i would get transmitt furthur that I did with the TRC 217 40 channel walkie talkie.

The problem that had first was when I was going to hook this radio HTX-1000 to the antenna the conektor on the radio was wrong it wouldn't attach to my cable. I was able to hook it finally by making a small change in in the connektor. As soon as I tried to use it there was no sound coming at all. This happened for two days and I never did get to talk to anybody the whole two days. That day the cable company came knocking my door and said there was something causing problems at my house and disconnected my radio from the cable line. you knew when i brought the Radio that I was going to use that for my antenne. You didn't tell me not to why not?

Next time I decided to put the HTX-1000 in my automobile I thought I would see how it worked their. I hooked it to my CB-antenna and at least I could hear people. But what happens now is no one wants to talk to me because they says you have to have a licencs to talk to them. Why? I dont have to have a licencs to talk on my CB. They'll talk to me there. Anyhow it dont matter much anymore because somebody done took the radio HTX-1000 from my automobile.

What I would like for you Radio Shack to do is refund my money because I don't have the radio anymore and its not my fault i dont and I think you should give me back my money. Also the cable company here says that I hurt something in there line and want to be paid fix it. It will cost \$27482.98 to fix the equipment they say was damaged because you didnt tell me not to hook it to the cable. Please remit to me the check for \$27758.53 for damages due. To save this matter from going to court the check must be in my hand by June first or I will turn this over to my attorneys of law.

Thank you .

Amateur Radio

VIBROPLEX

This is an unusual type vertical Vibroplex. It occupies quite a small space on the desk. This has a very nice touch indeed and I found it difficult to imitate a "Lake Erie Swing" with it.
